CAPSTONE 26 – AI SEO Content Strategy Planner

Oct 29, 2026 · @Wasim

How can AI assist with keyword research and content planning? A complete, submission-ready project for the niche AI Tools and Digital Marketing for Students and Beginners.

How to read this document

- **[GENERATED]** = written by AI as an example, template or plan. It is not research.
- **[UNVERIFIED]** = a claim or keyword idea that you must check yourself before using it.
- **[YOUR RESULT]** = a blank you fill in after you actually run a tool or test. No search volumes, statistics or test results are invented here.
- Both articles are **AI-assisted drafts until you review them**.

Part 1 – Project Introduction

Abstract

This project shows how free AI tools can support keyword research and content planning for a blog in the niche *AI Tools and Digital Marketing for Students and Beginners*. It builds a 20-keyword list, a four-pillar topic cluster of 20 articles, two full article drafts, SEO metadata, a four-week publishing calendar, a prompt library and a verification process. AI is used to speed up ideas and drafts. A human checks facts, edits the text and approves every publication step. The project also records AI mistakes honestly, so the final result is a method that is practical, checkable and responsible.

Problem statement

Beginners who start a blog often pick topics by guessing, copy generic AI output, or publish without checking facts. AI tools can invent keyword data, sources and statistics. The problem is how to use AI to plan SEO content faster **without** losing accuracy, originality and trust.

Objectives

1. Build a keyword list for the chosen niche and mark what is verified and what is not.
2. Organise 20 article ideas into four content pillars with internal links.
3. Draft two SEO articles with AI and improve them by hand.
4. Create metadata and a four-week publishing calendar that can be imported into Notion.
5. Design and document a repeatable AI workflow with human approval points.
6. Test AI output for errors and record the corrections.
7. Explain the ethical limits of using AI for content.

Scope

In scope	Out of scope
Planning and drafting for one niche	Paid SEO tools (Ahrefs, Semrush)

In scope	Out of scope
Free-tier AI and research tools	Guaranteed Google rankings
Two full articles, 20 outlines and metadata	Writing all 20 full articles
A manual Notion setup guide	Automated publishing or API integrations
Verification and ethics documentation	Traffic or revenue results (a new blog has none yet)

Target audience

- College students learning AI tools for study and projects.
- Beginners starting a blog or a small online presence.
- Early-career learners in digital marketing, content writing or freelancing.

What they usually need: simple English, step-by-step guidance, free tools and honest advice.

Proposed methodology

1. **Define the niche** and audience.
2. **Collect keyword ideas** with Google Search suggestions, Google Trends, AnswerThePublic and Perplexity.
3. **Verify** each idea yourself and update its status.
4. **Cluster** keywords into four pillars and assign search intent.
5. **Draft** two articles with an AI assistant using the prompt library.
6. **Edit manually** with the checklists.
7. **Fact-check** every claim and log results in the verification report.
8. **Create metadata** and a Notion calendar.
9. **Reflect**: compare AI-only output with improved output using the rubric.

Tools and technologies

Tool	Free tier?	Use in this project	Evidence you must keep
Claude (AI assistant)	Yes	Planning, drafting, editing	Saved chat links or screenshots
Google Search (autocomplete, People Also Ask, Related searches)	Yes	Keyword ideas, intent checks	Screenshots with date
Google Trends	Yes	Compare interest in keywords over time (relative, not volume)	Screenshot of each comparison
AnswerThePublic	Limited free searches	Question-style keyword ideas	Screenshot of results

Tool	Free tier?	Use in this project	Evidence you must keep
Perplexity	Yes, limited	Research with source links	Screenshot plus the sources you opened
Notion	Yes	Publishing calendar database	Screenshot of the database
Google Sheets or Excel	Yes	Edit and clean the CSV	The CSV file

Documented tool use (honest status): Claude was used to generate this planning document. The other tools above are **not yet used** by the author of this text. You must run at least four of them and fill the *Tool Use Log* in Part 13 with real dates and screenshots before submission. Free-tier limits change, so check each tool's current plan.

Part 2 – Keyword Research

These are **candidate keywords [GENERATED, UNVERIFIED]**. They are ideas based on common beginner questions. No search volume or difficulty is given because none has been measured. Intent codes: **I** = informational, **C** = commercial investigation, **N** = navigational, **T** = transactional.

ID	Primary keyword	Secondary keywords	Long-tail keyword	Intent	Target audience	Research source (to use)	Verification status
K01	ai tools for students	best ai tools, free ai tools	free ai tools for college students	I/C	College students	Google suggest, Trends	UNVERIFIED
K02	free ai tools for beginners	beginner ai tools, easy ai tools	free ai tools for beginners with no coding	I	Beginners	Google suggest, ATP	UNVERIFIED

K20	ai workflow for content creation	content workflow, ai writing process	simple ai workflow for blog content	I	Bloggers	Perplexity, Google suggest	UNVERIFIED

Abbreviations: ATP = AnswerThePublic.

How to research and verify these keywords

Do this for each keyword. Save a dated screenshot as evidence. Change the status in the table only after you have done the check.

1. Google Search suggestions (autocomplete, People Also Ask, Related searches)

1. Open Google in a private window so your history does not shape results.
2. Type the primary keyword slowly. Note the suggestions that appear.
3. Search the keyword. Note the *People Also Ask* questions and the *Related searches* at the bottom.
4. Read the top results. Are they guides, lists, tools or videos? That shows the real search intent.
5. Record: the date, the new phrases found, and the type of pages that rank.

2. Google Trends

1. Open Google Trends and enter up to five keywords to compare.
2. Set the region (for example India) and a time range (for example past 12 months).
3. Read the chart as *relative interest* from 0 to 100. It is **not** a search volume.
4. Check *Related queries* for rising ideas.
5. Record: the date, region, range and which keyword was higher. Do not write any number of searches.

3. AnswerThePublic

1. Enter the primary keyword and choose your country and language.
2. Review the question groups (what, why, how, can, are).
3. Pick questions that fit your audience and note them as long-tail ideas.
4. Free searches are limited, so plan which keywords to check first.

4. Perplexity

1. Ask a research question, for example: *"What questions do beginners ask about keyword research? Give sources."*
2. Open every source link it gives. Do not trust the summary alone.
3. Use it for ideas and source discovery, not for search volume.
4. Record each useful source in the References list with the title, site and date accessed.

Verification status labels

Status	Meaning
UNVERIFIED	AI-suggested idea, not yet checked
PARTLY VERIFIED	Appears in one tool (for example Google suggest)
VERIFIED	Appears in at least two tools and intent is checked on real results
REJECTED	Not relevant, too broad or no supporting evidence

Part 3 – Topic Cluster Map

The 20 articles sit in four pillars. Each pillar has **one pillar page** (a broad guide) and **four supporting articles** (narrow topics that link up to the pillar and sideways to each other). All ideas are **[GENERATED, UNVERIFIED]** until the keyword checks in Part 2 are done. A20 uses one extra keyword (*blog publishing checklist*) that is not in the 20-keyword table, so verify it too.

Pillar pages: A01, A06, A11, A16.

Pillar 1 – AI Tools for Beginners

ID	Article title	Primary keyword	Intent	URL slug	Role	Priority	Internal links to
A01	Free AI Tools for Students: A Beginner's Complete Guide	ai tools for students	I/C	/ai-tools-for-students	**Pillar**	High	A02, A03, A04, A05, A11, A16

A20	Blog Publishing Checklist: From Idea to Published Post	blog publishing checklist	I	/blog-publishing-checklist	Supporting	Low	A16, A14, A17

Linking rules

1. Every supporting article links **up** to its pillar page in the first 200 words.
2. Every pillar page links **down** to all four of its supporting articles.
3. Each article links **sideways** to at least one article in another pillar (for example A06 links to A16).
4. Use descriptive anchor text such as *keyword research for beginners*, never *click here*.
5. Only add a link once the target page exists; until then keep it as a planned link in the calendar.

Part 4A – SEO Article 1 (A06)

Status: AI-ASSISTED DRAFT – not reviewed. Do not publish until the editing checklist below is complete.

Long-tail keyword	how to do keyword research for a new blog
Pillar	SEO and Keyword Research (pillar page)

Keyword Research for Beginners: A Simple Step-by-Step Guide

If you start a blog without knowing what people search for, you are writing in the dark. **Keyword research for beginners** is the habit of finding the words your readers type into a search engine, and then writing pages that answer them. This guide shows a simple process you can follow with free tools. You will learn what keywords are, how to find them, how to check them, and how to turn them into a plan. If you want the bigger picture of planning, read our guide on how to plan blog content.

What Is Keyword Research?

A keyword is a word or phrase that a person types into a search engine. Keyword research means collecting these phrases, understanding why people search them, and choosing the ones that fit your blog.

Why it matters for a new blog

- It tells you what your audience wants to know.
- It stops you from writing about topics nobody searches for.
- It helps you choose topics that a small, new site has a fair chance to compete for.

Keywords are not the same as topics

A **topic** is a broad subject, such as *AI tools for students*. A **keyword** is the exact wording people use, such as *free ai tools for college students*. One topic can contain many keywords.

Step 1: Define Your Niche and Audience

Write one sentence that says who you help and with what. Example: *"I help college students and beginners learn AI tools and digital marketing."* This sentence keeps your keyword list focused.

Questions to ask

1. Who is my reader (student, freelancer, small business owner)?
2. What problem do they want to solve?
3. What words would they use, not the words experts use?

Step 2: Collect Seed Keywords

Seed keywords are short, simple starting phrases. For the niche above, seeds could be *ai tools*, *seo*, *blog content* and *content calendar*.

Where to find ideas for free

- **Google autocomplete:** type a seed and note the suggestions.
- **People Also Ask and Related searches:** these show real questions and variations.
- **AnswerThePublic:** shows questions starting with who, what, why, how and can. The free plan limits searches.
- **Your own questions:** note what confused you when you started.

Practical example

Seed: *keyword research*. After typing it into Google you might note ideas such as "keyword research for beginners" or "free keyword research tools". Treat these as **ideas to check**, not proof that many people search them.

Step 3: Understand Search Intent

Search intent is the reason behind a search. Match your page to it, or readers will leave.

Intent	What the person wants	Example phrase	Best page type
Informational	To learn	what is a long tail keyword	Guide, explainer
Commercial investigation	To compare options	best free keyword tools	Comparison list
Navigational	To reach a site	google trends	Brand or tool page
Transactional	To buy or sign up	notion template download	Product or sign-up page

How to check intent

Search the keyword in Google and look at the first page. If the results are mostly step-by-step guides, your page should be a guide. If they are product lists, a long essay may not match.

Step 4: Check Interest With Google Trends

Google Trends shows **relative** interest over time on a scale from 0 to 100. It does not show how many searches happen.

How to use it

1. Enter two to five keywords.
2. Choose your region and time range.
3. See which phrase is more popular, and whether interest is rising, falling or seasonal.

4. Check *Related queries* for new ideas.

Example: compare *ai tools for students* with *ai study tools*. Write down which line is higher and the date you checked. Do not write a search number, because Trends does not give one.

Step 5: Choose Long-Tail Keywords First

Long-tail keywords are longer, more specific phrases. They often show clearer intent and may face less competition, which can suit a new blog. This is general SEO guidance, so test it on your own site.

Broad keyword	Long-tail version
ai tools	free ai tools for college students
keyword research	how to do keyword research for a new blog
content calendar	how to make a content calendar in notion

Step 6: Use AI to Speed Up, Not to Decide

AI assistants can suggest keyword ideas, group them and draft outlines. They can also invent facts, including search volumes.

Safe ways to use AI

- Ask for ideas, groups and question lists.
- Ask it to explain intent in simple words.
- Ask for a draft table that you then verify.

Unsafe ways

- Trusting search volume or difficulty numbers from the chat.
- Copying sources that you have not opened.

Sample prompt: *"Act as an SEO assistant for a blog for students. Suggest 15 long-tail keywords about free AI tools. Group them by search intent. Do not give search volumes. Mark everything as unverified."*

Step 7: Build a Simple Keyword Table

Use a spreadsheet with these columns:

Keyword	Intent	Source	Priority	Status
free ai tools for college students	Informational	Google suggest	High	Checked on [date]
how to do keyword research for a new blog	Informational	People Also Ask	High	Checked on [date]

How to set priority

Give higher priority to keywords that (1) fit your audience, (2) have clear intent, (3) you can answer better than the current top pages, and (4) support your other articles.

Step 8: Turn Keywords Into Content

Group related keywords into a **topic cluster**: one broad pillar page and several narrow supporting articles that link to each other. For example, a pillar on keyword research can link to articles on search intent, Google Trends and long-tail keywords. See what is search intent and long-tail keywords.

Common Beginner Mistakes

- Choosing keywords that are too broad.
- Ignoring search intent.
- Stuffing the keyword many times in the text.
- Believing numbers from AI chats without checking.
- Targeting many keywords on one page.

Conclusion

Keyword research is a repeatable habit: define your reader, collect ideas, check intent, compare interest, choose long-tail phrases and organise them into clusters. Use AI as a helper for speed, and use real search results as your proof. Start with five keywords this week, write one helpful article for each, and review what you learned.

FAQs

What is keyword research in simple words? It is finding the phrases people type into search engines so you can write pages that answer them.

Do I need paid tools to start? No. You can begin with Google autocomplete, People Also Ask, Google Trends and limited free tools. Paid tools offer more data but are not required to learn the process.

How many keywords should a beginner target? One main keyword per page, plus a few related phrases that fit naturally.

Can AI do keyword research for me? AI can suggest and group ideas, but it cannot replace checking real search results. Verify its suggestions.

How long does it take to see results? Results vary by site and competition, so no time can be promised. Track your pages and review regularly.

Internal linking suggestions

Link text	Target	Placement
how to plan blog content	/how-to-plan-blog-content (A16)	Introduction

Link text	Target	Placement
what is search intent	/what-is-search-intent (A07)	Step 3
how to use Google Trends	/how-to-use-google-trends (A08)	Step 4
long-tail keywords	/long-tail-keywords (A09)	Step 5
free keyword research tools	/free-keyword-research-tools (A10)	Step 2

Suggested image alt text

1. "Four-step flow from seed keyword to topic cluster for a beginner blog"
2. "Google Trends comparison screenshot of two keyword phrases [add your own screenshot]"
3. "Example keyword table with intent and priority columns"

Manual editing checklist – Article 1

- ☐ Read the whole draft aloud and fix awkward sentences.
- ☐ Replace generic examples with your own screenshots and real keyword checks.
- ☐ Confirm that Google Trends shows relative interest (0–100) and check the current interface.
- ☐ Confirm the current free-plan limits of AnswerThePublic before mentioning them.
- ☐ Confirm every tool name and feature is current.
- ☐ Remove any claim you cannot support (for example "may face less competition" – test it or soften it).
- ☐ Check that the primary keyword is in the title, H1, first 100 words, one H2 and the meta description, without stuffing.
- ☐ Add 2–3 reliable external sources (for example Google Search Central documentation) and open every link.
- ☐ Check that all internal links point to pages that exist.
- ☐ Add alt text and your own images.
- ☐ Run a plagiarism check and keep the report.
- ☐ Add the AI-use disclosure line at the end.
- ☐ Change the status from AI-assisted draft to Reviewed, with your name and date.

Part 4B – SEO Article 2 (A12)

Pillar	AI Content Writing (supporting article)

How to Write a Blog Post With AI: A Beginner's Guide

AI can help you write a blog post faster, but it cannot make the post good by itself. Readers and search engines look for pages that are useful, correct and written for people. This guide explains **how to write a blog post with AI** in seven steps, from idea to a post you can publish with confidence. The main rule is simple: AI drafts, and you decide. For the full overview, read our AI content writing guide for beginners.

Why Use AI for Blog Writing?

What AI does well

- Suggests topic ideas and outlines.
- Writes a rough first draft that saves time.
- Rewrites text in a simpler tone.
- Creates titles, summaries and FAQ ideas.

What AI does badly

- It may state wrong facts with confidence.
- It can invent sources, quotes and numbers.
- It often writes in a generic voice.
- It does not know your own experience or your readers' real questions.

Step 1: Start With a Clear Keyword and Intent

Before you open an AI tool, know what the post is for. Choose one primary keyword and check what type of page already answers it.

Example

Keyword: *how to write blog post with ai*. The reader wants steps, so the post should be a how-to guide, not a product review.

See keyword research for beginners if you need help choosing a keyword.

Step 2: Write a Strong Prompt

A clear prompt gives better results than "write a blog post about X". Include the audience, goal, tone, length, keyword and rules.

A simple prompt formula

Role + Audience + Task + Keyword + Format + Rules

Example prompt: *"You are a blog editor. Create an outline for beginners, written in simple English, for the keyword 'how to write blog post with ai'. Use H2 and H3 headings and include a short FAQ. Do not invent statistics or sources. Mark any claim that needs checking."*

See AI writing prompts for blog outlines for more prompts.

Step 3: Review and Improve the Outline

Do not accept the first outline.

Outline check

1. Does the order answer the reader's question step by step?
2. Is anything missing that top pages cover?
3. Is anything unnecessary or repeated?
4. Do the headings sound like how real people search?

Example: weak versus improved heading

Weak heading	Improved heading
Introduction to AI writing	Why use AI to write a blog post?
Tips	5 simple prompt tips for better drafts

Step 4: Draft Section by Section

Ask the AI to write one section at a time. This gives you more control than asking for the whole article at once.

Tips for better drafts

- Give it your notes, examples and facts to include.
- Ask for short sentences and plain words.
- Ask it to list claims that need a source.
- Add your own experience, a screenshot or a small example.

Step 5: Edit Like a Human

Editing is where an AI draft becomes your article.

Edit for voice and clarity

- Cut filler phrases and repeated ideas.
- Replace vague words with specific ones.
- Keep paragraphs short for mobile readers.
- Read the text aloud. If you would not say it, change it.

Edit for value

Ask: *What does this post give the reader that a generic AI answer does not?* Add a real example, a checklist or a template. See how to edit AI-generated content.

Step 6: Fact-Check Every Claim

This step protects your reputation.

Fact-checking process

1. Highlight every number, date, name, tool feature and claim.
2. Find the original source (official website, documentation or a reliable publication).
3. Open the link yourself. Do not trust a link the AI gave you until you have read the page.
4. Fix or delete anything you cannot confirm.
5. Record the check in a verification log.

Example

AI sentence	Problem	Fix
"This free tool has unlimited searches."	Plans change and the claim has no source	Check the current plan page and write what it says, with the date

Step 7: Add SEO Details and Publish

- Put the primary keyword naturally in the title, H1, first paragraph and meta description.
- Write a clear meta description that matches the page.
- Use a short, readable URL slug.
- Add internal links to related posts, such as a simple AI workflow for blog content.
- Add descriptive alt text to images.
- Add an honest note that AI helped with drafting, if that fits your site policy.

Common Mistakes to Avoid

- Publishing the first draft without reading it.
- Copying invented sources.
- Using the same generic structure for every post.
- Stuffing keywords.
- Hiding the use of AI when your school or client requires disclosure.

Conclusion

AI is a good writing assistant and a poor publisher. Use it for ideas, outlines and rough drafts. Then add your experience, edit for clarity, check every fact and prepare the SEO details yourself. Try the seven steps on one short post this week and keep a note of what you changed. That note shows your real contribution.

FAQs

Can I publish AI-written content directly? It is risky. AI text can contain errors and may sound generic. Review, edit and fact-check before publishing.

Will search engines penalise AI content? Check Google's current guidance on AI-generated content in its Search Central documentation. In general, helpful and accurate content written for people is the goal, regardless of how it was drafted. Confirm this against the live documentation before you publish this claim.

Which AI tool is best for blog writing? It depends on your needs and free-plan limits. Try two or three tools with the same prompt and compare accuracy and clarity.

How long should a blog post be? Long enough to answer the question fully. Look at the pages that rank and aim to be more useful, not just longer.

Do I need to tell readers I used AI? Check your college, client or platform rules. Honest disclosure is a good habit.

3. "Fact-checking table comparing an AI sentence with its verified correction"

Manual editing checklist – Article 2

- ☐ Read the full draft aloud and rewrite stiff or generic sentences.

- ☐ Replace the sample prompts with prompts you actually tested, and show a real before-and-after.
- ☐ Check Google's current AI-content guidance on Search Central and quote only a short, correctly attributed part, or paraphrase it.
- ☐ Remove the FAQ answer about search engines if you cannot confirm it.
- ☐ Add one real example from your own workflow, with a screenshot.
- ☐ Verify every tool feature and plan limit mentioned.
- ☐ Check keyword placement: title, H1, first 100 words, one H2, meta description.
- ☐ Check that all internal links point to published pages.
- ☐ Add alt text and your own images.
- ☐ Run a plagiarism check and save the report.
- ☐ Add the AI-use disclosure statement.
- ☐ Change the status from AI-assisted draft to Reviewed, with your name and date.

Part 5 – SEO Metadata (All 20 Articles)

All metadata is **[GENERATED]**. SEO titles are kept near 60 characters and meta descriptions near 150 characters, but search engines may rewrite them, so treat these as targets. A06 and A12 match the two drafts above. For the other 18, **re-check each line against the finished article** before publishing.

Metadata quality checks

- ☐ The primary keyword appears in the SEO title and the meta description, naturally.
- ☐ The meta description promises only what the article delivers.
- ☐ Each slug is short, lowercase and unique.
- ☐ No two articles share the same SEO title or primary keyword.
- ☐ Titles are checked in a preview tool, since display length depends on pixel width.

Part 6 – Notion Publishing Calendar

No Notion database has been created. I do not have access to your Notion workspace. This part gives you the plan, a table and CSV data, and the steps to build the database yourself.

The plan assumes five articles per week for four weeks, starting Monday 2 November 2026. Writing deadline = two days before publication. Shift the dates if five posts a week is too heavy; a smaller number of better-edited posts is acceptable and honest. Pillar pages are published early so supporting articles can link up to them.

Four-week publishing plan

Week	ID	Title	Keyword	Content pillar	Writing deadline	Publication date	Status	SEO title	Meta description	Verification status

How to create the Notion database manually

Option A – Import the CSV

1. Save the CSV text above as a `.csv` file.
2. In Notion, find the **Import** option (its location in the sidebar or menu can change) and choose **CSV**.
3. Open the new database. Change property types: *Content Pillar*, *Status* and *Verification Status* to **Select**; *Writing Deadline* and *Publication Date* to **Date**; *Week* to **Number**.
4. Add a **Calendar** view using *Publication Date*, and a **Board** view grouped by *Status*.
5. Take a screenshot for your report.

Option B – Build it by hand

1. Create a new page called *AI SEO Content Calendar* and add a **Table** database.
2. Rename the title property to *Title*, then add the properties listed in the CSV header with the types above.
3. Add the Status options: *Idea, Planned, AI draft (unreviewed), Edited, Fact-checked, Scheduled, Published*.
4. Paste the rows from the table, or type them in.
5. Add the Calendar and Board views.

After a post is live: change Status to *Published* and add the real URL and publish date. Add columns for results only when you have real data.

Part 7 – AI Accuracy and Hallucination Report

A *hallucination* is AI output that sounds confident but is false, invented or unsupported. This section gives a **template** for your real log and **illustrative examples**. The examples are **[GENERATED, ILLUSTRATIVE]**. They show the *type* of error to look for. They are **not** results from a real test, and you must not present them as your findings.

A. Verification log template (use this for your real results)

Log ID	Article	AI-generated claim (copy exactly)	AI tool and prompt	Source opened (title + URL)	Date checked	Problem type	Correction	Final status	Checked by
V01	[YOUR RESULT]	[YOUR RESULT]	[YOUR RESULT]	[YOUR RESULT]	[YOUR RESULT]	[YOUR RESULT]	[YOUR RESULT]	[YOUR RESULT]	[YOUR RESULT]
V02									
V03									

Problem types: invented number · invented or unopenable source · outdated · overgeneralised · wrong tool feature · misleading advice · biased wording · copied phrasing.

Final status values: *Verified* (source confirms it) · *Corrected* (rewritten to match the source) · *Removed* (cannot be confirmed) · *Opinion* (clearly labelled as advice, not fact).

B. Illustrative examples [NOT REAL TEST RESULTS]

ID	AI-generated claim	Verification source (what to check)	Identified problem	Correction	Final status
E1	"Google Trends shows the exact number of searches for each keyword."	Google Trends Help pages and the tool itself	Wrong tool feature: Trends shows relative interest on a 0–100 scale, not search counts	"Google Trends shows relative interest over time, not exact search numbers."	Corrected
E2	"The keyword 'ai tools for students' gets 40,500 searches a month."	A keyword tool you actually used, with a dated screenshot	Invented number: the chat had no data source	Delete the number. Write "search volume not measured" or use your own screenshot	Removed
E3	"A 2024 university study found that most students use AI daily."	Search for the study; open the original paper or report	Invented or unopenable source; vague claim	Replace with a real, opened source and paraphrase it, or delete the sentence	Removed (until a real source is found)
E4	"AnswerThePublic has unlimited free searches."	The tool's current pricing page	Outdated or false: free plans usually have limits and change	"AnswerThePublic offers limited free searches. Check its current plan."	Corrected

ID	AI-generated claim	Verification source (what to check)	Identified problem	Correction	Final status
E5	"Long-tail keywords always rank faster."	A reliable SEO guide plus your own tracking	Overgeneralised: "always" cannot be supported	"Long-tail keywords often face less competition, but results vary. Test and track."	Corrected
E6	"A meta description directly raises your Google ranking."	Google Search Central documentation about snippets and titles	Possibly misleading: meta descriptions mainly affect how a result is shown; do not claim a ranking effect without a source	Rewrite to what the documentation says, and cite the page you opened	Corrected (after reading the live page)

C. How to verify real claims

1. **Highlight every checkable claim** in a draft: numbers, dates, names, tool features, "always/never/best" words, and any cited source.
2. **Find the primary source.** Prefer official documentation, the tool's own website, government or university pages, and original reports.
3. **Open the link yourself.** If a source does not exist, does not open or does not say what the AI claimed, mark it as a hallucination.
4. **Test tool claims in the tool.** Open Google Trends or AnswerThePublic and see what it really shows. Screenshot it with the date.
5. **Check recency.** Free-plan limits, interfaces and policies change. Write the date you checked.
6. **Rewrite in your own words** and add the source. Quote only short phrases.
7. **Log it** in the template above. Count honestly, including claims that were correct.

D. How to document real results

- Keep a folder with dated screenshots and saved chat links.
- Fill the log for **every** AI-assisted article. Do not delete rows where AI was right.
- Summarise at the end with real counts:

Measure	Your count
Claims checked	[YOUR RESULT]
Verified as correct	[YOUR RESULT]
Corrected	[YOUR RESULT]

Measure	Your count
Removed	[YOUR RESULT]
Most common problem type	[YOUR RESULT]

If you check only a few claims, say so. A small honest sample is better than a large invented one.

Part 8 – Before-and-After Analysis

The five pairs below are **[GENERATED, ILLUSTRATIVE]**. The "before" text imitates common weak AI output. It is not a quote from a real test. No scores are claimed here. Score your own real outputs with the rubric.

A. Five examples

#	Generic or inaccurate AI suggestion (before)	Improved version (after)
1	"Use keywords like AI and marketing to get traffic."	"Target a specific phrase such as 'free ai tools for college students' (informational). Verify it in Google suggest and check the top results for intent."
2	"'Free AI tools for students' gets about 12,000 searches a month."	"Search volume not measured. Google Trends comparison on [date] shows relative interest only. Add a real number only if a tool you used shows it."
3	Title: "Everything You Need to Know About AI"	Title: "Free AI Tools for Students: A Beginner's Guide"
4	Meta: "This is an article about AI tools. Read it now!"	Meta: "Find beginner-friendly AI tools for study, writing and planning. Learn how to choose tools and check free plans."
5	"Studies show AI improves productivity by 40%."	"AI tools may save time on some tasks, but results vary. [Add a real, opened source before stating any percentage.]"

B. Comparison (what changes in each pair)

#	Accuracy	Readability	Keyword relevance	Search intent	Usefulness
1	Advice becomes checkable	Concrete example replaces buzzwords	Broad words replaced by a long-tail phrase	Intent named and tested on real results	Reader knows what to do next
2	Removes an invented number	Clear label of what is unknown	Keyword kept	Not affected	Prevents false reporting

#	Accuracy	Readability	Keyword relevance	Search intent	Usefulness
3	No false promise ("everything")	Shorter, specific	Primary phrase in the title	Matches a guide or list search	Reader knows what the page covers
4	Describes the real content	Complete sentences, no pressure phrase	Contains the topic phrase	Matches informational intent	Gives a reason to click
5	Removes an unsupported statistic	Honest hedge, easy to read	Not affected	Not affected	Shows exactly what to verify

C. Evaluation rubric (score 1–5)

Criterion	1 (poor)	3 (acceptable)	5 (excellent)
Accuracy	Contains false or invented facts	Mostly correct, a few unchecked claims	Every claim verified with an opened source
Readability	Confusing, long, filled with jargon	Clear but plain or repetitive	Simple, well-structured, natural voice
Keyword relevance	Keyword missing or stuffed	Present but not well placed	Natural use in title, H1, intro, metadata
Search intent match	Wrong page type for the query	Partly matches	Matches what top results show
Usefulness	Generic, nothing new	Helpful but common	Practical steps, examples and original value

D. How to run your own before-and-after test

1. Give the AI a plain prompt (version A). Save the output as the **before**.
2. Improve it by hand or with a better prompt (version B). Save the **after**.
3. Ask a classmate or mentor who has not seen which is which to score both from 1 to 5.
4. Record the scores below. Report the real numbers, even when the difference is small.

Pair	Criterion	Before score	After score	Scorer	Notes
[YOUR RESULT]	Accuracy				
[YOUR RESULT]	Readability				
[YOUR RESULT]	Keyword relevance				

Pair	Criterion	Before score	After score	Scorer	Notes
[YOUR RESULT]	Search intent match				
[YOUR RESULT]	Usefulness				

With so few samples, call the result *an observation from a small test*, not proof.

Part 9 – Prompt Library

Replace text in [square brackets] before use. Each prompt tells the AI **not** to invent data. These prompts are **[GENERATED]** and untested until you run them and record the results.

A. Eleven reusable prompts

ID	Category	Prompt	Purpose	Expected output
P01	Keyword research	"Act as an SEO assistant for a blog about [niche] for [audience]. Suggest 20 keyword ideas. For each give a primary keyword, one long-tail version and the likely search intent. Do not give search volumes or difficulty scores. Label every row UNVERIFIED. Output a table."	Generate keyword ideas to check later	Table of 20 ideas, no invented numbers
P02	Audience research	"Describe 3 audience personas for a blog about [niche]. For each give goals, 5 questions they may search, and what confuses them. State clearly that these are assumptions, not research findings."	Understand readers before writing	3 short personas with question lists, labelled as assumptions
P03	Search intent	"Classify these keywords by search intent (informational, commercial, navigational, transactional) and suggest the best page type for each. Give one sentence of reasoning. Say where you are unsure. Keywords: [list]"	Match page type to intent	Table: keyword, intent, page type, reason, uncertainty
P04	Topic clustering	"Group these keywords into four pillars named [pillar names]. For each pillar suggest one pillar page and four supporting articles. Output a table with title, primary keyword, intent, URL slug and internal links. Do not reuse a primary keyword. Keywords: [list]"	Build the topic map	Table of 20 article ideas in four pillars

ID	Category	Prompt	Purpose	Expected output
P05	Article writing	"Write a draft for the title [title] for [audience]. Primary keyword: [keyword]. Use simple English, H2 and H3 headings, one practical example per main section, a conclusion and 5 FAQs. Do not invent statistics, sources or quotes. After the draft, list every claim that needs fact-checking."	First draft plus a claims list	Structured draft and a numbered list of claims to verify
P06	SEO metadata	"For this article summary [summary], write 3 options of SEO title (max 60 characters) and meta description (max 155 characters) including [keyword] naturally. Do not promise anything the article does not cover."	Create matching metadata	3 title/description pairs to choose from
P07	Internal linking	"Here is my list of planned articles: [table of titles and slugs]. For the article [title], suggest 3–5 internal links with anchor text and where to place them. Use only articles in my list."	Plan links within the cluster	Table: anchor text, target slug, placement
P08	Fact-checki ng	"List every factual claim in the text below as a numbered table: claim, type (number, date, tool feature, source), risk level, and what primary source I should check. Do not say whether the claims are true and do not add sources. Text: [paste]"	Find what to verify, without trusting AI judgement	Claim list with checking instructions
P09	Article editing	"Edit this draft for clarity for beginners. Keep my meaning. Use shorter sentences and active voice. List each change you made. Flag sentences that sound generic. Do not add new facts. Text: [paste]"	Improve style without adding errors	Edited text plus a change list and flags
P10	Notion calendar creation	"Create CSV data with columns [column list] for these 20 articles: [list]. Schedule 5 per week for 4 weeks from [start date]. Use ISO dates. Put quotes around fields with commas. Do not invent any data."	Build the import file	CSV text ready to save
P11	Content evaluation	"Score this article from 1 to 5 on accuracy, readability, keyword relevance, search intent match and usefulness, using this rubric: [rubric]. Give one reason and one	Get a second opinion,	Score table with reasons

ID	Category	Prompt	Purpose	Expected output
		improvement for each score. State clearly that you cannot confirm accuracy without sources."	then check it yourself	

B. Comparing two versions of three prompts

The "expected difference" column is a **hypothesis to test**, not a result.

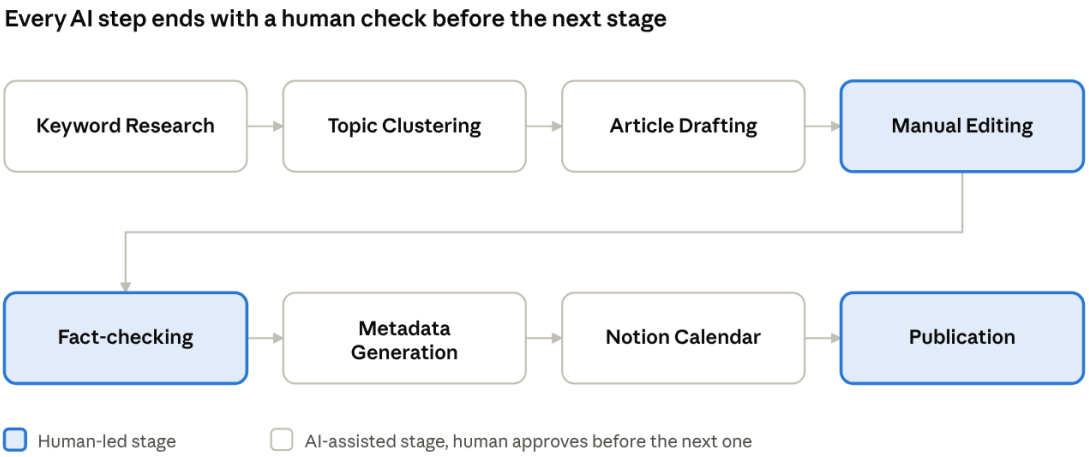

Prompt	Version A (basic)	Version B (improved)	Expected difference (to test)
Keyword research (P01)	"Give me keywords for an AI blog."	P01 above	B should give clearer intent and fewer invented numbers; A may return broad keywords
Article writing (P05)	"Write a blog post about keyword research."	P05 above	B should match audience and structure and list claims to check; A may be generic
Fact-checking (P08)	"Is this article correct?"	P08 above	B should give a checklist of claims; A may say "yes" without evidence

C. How to test which version works better

1. **Fix the variables.** Use the same AI tool, same topic and a new chat for each run. Change only the prompt.
2. **Run each version at least 3 times.** AI output varies, so one run can mislead.
3. **Hide the labels.** Ask a classmate to score the outputs from 1 to 5 using the rubric in Part 8, without knowing which version made which.
4. **Count objective items:** invented numbers or sources found, claims needing correction, minutes spent editing, and whether the intent matched the top Google results.
5. **Record and compare** in the table below, then report what you saw, with the limits of the small sample.

Prompt tested	Version	Run	Avg rubric score	Invented items found	Edit time (min)	Notes
[YOUR RESULT]	A	1				
[YOUR RESULT]	B	1				

Part 10 – AI Workflow

AI content workflow · 8 stages, 3 human-led

Read the diagram left to right on the top row, then left to right on the bottom row. Accent boxes are stages where a human does the main work. Every other stage uses AI, but you approve its output before moving on.

Stage details

#	Stage	What happens	Free tools	Input	Output	Human approval point	Possible automation (PROPOSED only)
1	Keyword Research	Collect ideas, check them in real tools, set status	Google suggest, Google Trends, AnswerThePublic, Perplexity, Claude (P01)	Niche, audience, seed keywords	Keyword table with verification status	You approve which keywords are VERIFIED	Prompt P01 to draft ideas; a Google Sheet to hold the table
2	Topic Clustering	Group keywords into pillars, set intent, slugs and links	Claude (P03, P04), Google Sheets	Verified keywords	Topic cluster map of 20 articles	You approve the map and priorities	One prompt that outputs the map as a table or CSV

#	Stage	What happens	Free tools	Input	Output	Human approval point	Possible automation (PROPOSED only)
3	Article Drafting	AI writes a draft from your brief and facts	Claude (P05)	Title, keyword, intent, notes and your own examples	Draft plus a list of claims to check	You approve the outline before drafting	A saved prompt template; no bulk publishing
4	Manual Editing	Rewrite for voice, clarity and original value	You, plus Claude (P09) for suggestions	Draft	Edited article	You read it fully and complete the editing checklist	AI may suggest edits; you accept each one
5	Fact-checking	Verify every claim against opened sources and log results	Perplexity, official documentation, a free plagiarism checker, Claude (P08)	Edited article, claims list	Verification log and corrected article	Every claim is Verified, Corrected or Removed	AI may extract the claims list; checking stays manual
6	Metadata Generation	Create SEO title, description, slug and alt text	Claude (P06), a snippet preview tool	Final article	Metadata that matches the article	You check that metadata matches the content	A prompt per article, results pasted into the sheet
7	Notion Calendar	Add article, dates and status to the calendar	Notion, CSV, Claude (P10)	Metadata and dates	Notion database	You check the dates and statuses	CSV import; a connector tool such as Zapier or the Notion API could sync data (check free limits first)

#	Stage	What happens	Free tools	Input	Output	Human approval point	Possible automation (PROPOSED only)
8	Publicatio n	Upload, add images and links, publish	Your blog platform	Approved article, metadata, images	Live post with a URL	Final read, links tested, AI disclosure added	Scheduled posting in your blog platform

Proposed automation vs implemented automation

Nothing in this project has been automated or tested yet. Use this table to be honest about the difference.

Automation idea	Status	Evidence
Saved prompts reused for each article	Proposed	None yet
CSV import into Notion	Proposed	[YOUR RESULT: screenshot after you import it]
Claims-list extraction with P08	Proposed	[YOUR RESULT: log of one run]
Zapier, Notion API or scheduled posting	Proposed only; do not claim it works	None. Test it first and record the result

Change *Proposed* to *Implemented and tested* only after you ran it, saw it work and saved proof.

Part 11 – Responsible AI and Ethics

AI helps with speed. It does not carry responsibility. You do.

Issue	What it means here	What you will do
Data privacy	Text typed into AI tools may be stored or used under the tool's terms	Never paste personal data, passwords, private documents or other people's confidential work. Read each tool's privacy settings. Use only public or your own content
Copyright and plagiarism	AI output may resemble existing text; copying others' work without credit is plagiarism	Rewrite in your own words, quote only short parts with credit, run a plagiarism check, and do not copy articles or lyrics
Originality	Generic AI text adds little value	Add your own examples, screenshots, test results and opinions. Keep notes of your edits

Issue	What it means here	What you will do
Honest disclosure of AI use	Readers, teachers and clients may expect to know	State where AI helped. Follow your college rules. Never present AI work as fully your own
Source attribution	Facts need credit and a place to check them	Cite only sources you have opened. List them in References with the date accessed
Hallucinations	AI can invent facts, numbers and sources	Verify every claim (Part 7). Delete what you cannot confirm
Bias	AI may reflect narrow views, stereotypes or Western-only examples	Check examples for fairness and relevance to Indian and global students. Ask for different viewpoints
Limits of free tools	Free plans can limit searches, features, history and accuracy, and they change	Record the plan and date. Do not claim paid-tool results. Say what you could not test
Human responsibility	You publish, so you answer for the content	You approve every stage. Keep the verification log. Correct mistakes after publication

AI-use disclosure statement (short)

> *This project used AI tools (such as Claude) to help brainstorm keywords, plan content, draft text and suggest metadata. The author reviewed and edited the content, checked factual claims against the sources listed in the References, and is responsible for the final work. AI suggestions that could not be verified were removed or marked as unverified.*

Edit the tool names to match what you actually used.

Part 12 – AI Skills Mapping (PROVISIONAL)

Provisional: the official course syllabus for Topics 1–9 was not available. Skills are mapped to common AI-course areas. Replace the topic numbers and names once you have the syllabus and your instructor confirms them.

#	AI skill	Where it appears in the project	Evidence you can show	Course topic (to confirm)
1	AI foundations (what generative AI can and cannot do)	Objectives, hallucination report, limitations	Explanation in viva; verification log	[Topic to confirm]
2	Prompt engineering	Prompt library and prompt version comparison	Saved prompts, outputs and your test table	[Topic to confirm]

#	AI skill	Where it appears in the project	Evidence you can show	Course topic (to confirm)
3	AI-assisted research	Keyword research with Trends, AnswerThePublic, Perplexity and Google	Dated screenshots, source list	[Topic to confirm]
4	Content creation with AI	Two SEO articles and 20 outlines	Draft, edited version and change notes	[Topic to confirm]
5	Verification and critical evaluation	Verification log, before-and-after rubric	Completed log with real counts	[Topic to confirm]
6	Responsible and ethical AI	Ethics section, disclosure, privacy rules	Disclosure statement, plagiarism check report	[Topic to confirm]
7	Workflow design and automation	Eight-stage workflow, Notion calendar	Diagram, Notion screenshot, automation status table	[Topic to confirm]
8	Data organisation and planning	Topic clusters, CSV for Notion	Notion database, spreadsheet	[Topic to confirm]
9	Communication and presentation	Final report, slides, live demo	Slide deck, demo recording or notes	[Topic to confirm]

Part 13 – Final Project Report

Use the chapters below as your report. Most chapters are already written in this document. Copy them into your college template in this order.

A. Report structure and where each chapter comes from

#	Chapter	Source in this document	What you still add
1	Cover page	Template below	Your name, roll number, guide, date
2	Abstract	Part 1	Add one sentence on your real findings
3	Introduction	Part 1	Short background in your words
4	Problem statement	Part 1	None
5	Objectives	Part 1	None
6	Methodology	Part 1 and Part 10	Dates when you did each step
7	Tools and technologies	Part 1 and the Tool Use Log below	Real use of at least four tools

#	Chapter	Source in this document	What you still add
8	Keyword research	Part 2	Updated status after real checks
9	Topic cluster map	Part 3	Changes you made
10	Two SEO articles	Part 4A and 4B	Your edited, reviewed versions
11	Metadata	Part 5	Final checked versions
12	Publishing calendar	Part 6	Notion screenshot
13	Workflow	Part 10	Which parts you actually ran
14	Prompt library	Part 9	Your real test table
15	Verification report	Part 7	Your completed log
16	Before-and-after analysis	Part 8	Your real scores
17	Ethics	Part 11 and Part 12	Plagiarism report, disclosure
18	Results and discussion	Section B below	Fill with your real data
19	Limitations	Section C below	Add your own
20	Conclusion	Section D below	Adjust to your results
21	References	Section E below	Add every source you open
22	Appendix	Section F below	Screenshots, CSV, logs

Cover page template

- **Project title:** CAPSTONE 26 – AI SEO Content Strategy Planner
- **Project question:** How can AI assist with keyword research and content planning for a blog or website?
- **Niche:** AI Tools and Digital Marketing for Students and Beginners
- **Submitted by:** [YOUR NAME], [ROLL NUMBER]
- **Course / programme:** [YOUR COURSE]
- **Guide / instructor:** [NAME]
- **Institution:** [COLLEGE NAME]
- **Date of submission:** [DATE]

B. Results and discussion

What the project produced (counted from this document): 20 candidate keywords, a 20-article topic map in four pillars, 2 article drafts, metadata for 20 articles, a four-week calendar with Notion-ready CSV, 11 reusable prompts, a verification template with 6 illustrative examples, 5 before-and-after pairs, an 8-stage workflow, and an ethics statement.

What is not yet known: keyword search demand, article quality scores, real AI error rates, and any ranking or traffic result. These need your own tests. Do not write them until you have the data.

Result area	What to report	Your real data
Keywords checked	How many moved from UNVERIFIED to PARTLY VERIFIED or VERIFIED, and how many were REJECTED	[YOUR RESULT]
AI errors found	Counts from the verification log (Part 7D)	[YOUR RESULT]
Prompt comparison	Which version scored higher and by how much, with the small-sample caveat (Part 9C)	[YOUR RESULT]
Before and after	Rubric scores (Part 8D)	[YOUR RESULT]
Time	Minutes spent with AI help versus a manual estimate from your own work	[YOUR RESULT]

Discussion points to write once you have data: where AI helped most (idea generation, structure, speed); where it needed correction (numbers, sources, tool features, generic wording); which human steps mattered most; what you would change next time.

C. Limitations

- Keywords are not measured: no search volume or difficulty data was used, and Google Trends gives only relative interest.
- Only two of 20 articles were drafted in full; the other 18 are outlines with metadata.
- Article drafts and prompts are untested until you run and record them.
- Free tools have limits on searches, features and history, and these change.
- A new blog has no traffic data, so ranking or traffic claims cannot be made.
- Results from a small sample, one niche and one AI assistant cannot be generalised.
- The skills mapping is provisional until the official syllabus is available.

D. Conclusion

AI can help a beginner plan SEO content faster by suggesting keywords, grouping them into clusters, drafting outlines and articles, and preparing metadata and calendars. It cannot replace real keyword checks, fact-checking, editing and honest disclosure. This project provides a repeatable workflow in which AI supports each stage and a human approves it. The value of the method depends on the verification step, which is why the project records AI mistakes instead of hiding them. Future work: publish the articles, track real performance in free tools such as Google Search Console, and refine the prompts using the results.

E. References

Open every source yourself, read it, and add the date you accessed it. Do not cite a source you have not opened.

1. Google Search Central. *Google Search's guidance on using generative AI content on your website.* https://developers.google.com/search/docs/fundamentals/using-gen-ai-content (a copy of this

page appeared in search results at developers.google.cn). Accessed: [DATE]. It says generative AI can help with research and structure, but creating many pages without adding value for users may break Google's spam policy on scaled content abuse. It also advises focusing on accuracy and quality, and suggests sharing how content was created.

2. Google Trends Help. *FAQ about Google Trends data.* https://support.google.com/trends/answer/4365533 (found as a link in secondary articles; open the original). Accessed: [DATE]. Use it to confirm that Trends shows relative interest on a 0–100 scale, not absolute search volume.
3. Google Search Central. Documentation on controlling search snippets and meta descriptions (search the Search Central site for "snippets"). Accessed: [DATE]. Secondary news articles describe it as saying page content is the primary source of snippets and that Google sometimes uses the meta description; confirm this on the live page.
4. [ADD: your Perplexity sources, each opened and dated]
5. [ADD: tool documentation or pricing pages you checked, each dated]

F. Appendix

Appendix A – Tool Use Log. Complete this with real dates. At least four tools must be genuinely used and documented.

Tool	Status now	Date used	What you did	Evidence
Claude (free tier)	Used to generate this planning document and its prompts	[CONFIRM DATE]	Planned structure, drafted content	Saved chat link or screenshot
Web search (inside Claude)	Used once to locate the three reference pages in section E	[CONFIRM DATE]	Looked up Google guidance on AI content, Trends data and snippets	Sources listed above; open and confirm them
Google Search suggestions	NOT YET USED	[YOUR RESULT]		Screenshot
Google Trends	NOT YET USED	[YOUR RESULT]		Screenshot
AnswerThePublic	NOT YET USED	[YOUR RESULT]		Screenshot
Perplexity	NOT YET USED	[YOUR RESULT]		Screenshot and opened sources
Notion	NOT YET USED	[YOUR RESULT]		Database screenshot

Appendix B – Evidence folder checklist

- ☐ Keyword research screenshots (dated)
- ☐ Saved AI chats for each draft
- ☐ Completed verification log
- ☐ Plagiarism check reports for both articles
- ☐ Notion database screenshot and the CSV file
- ☐ Prompt test table with real scores
- ☐ Final reviewed versions of both articles

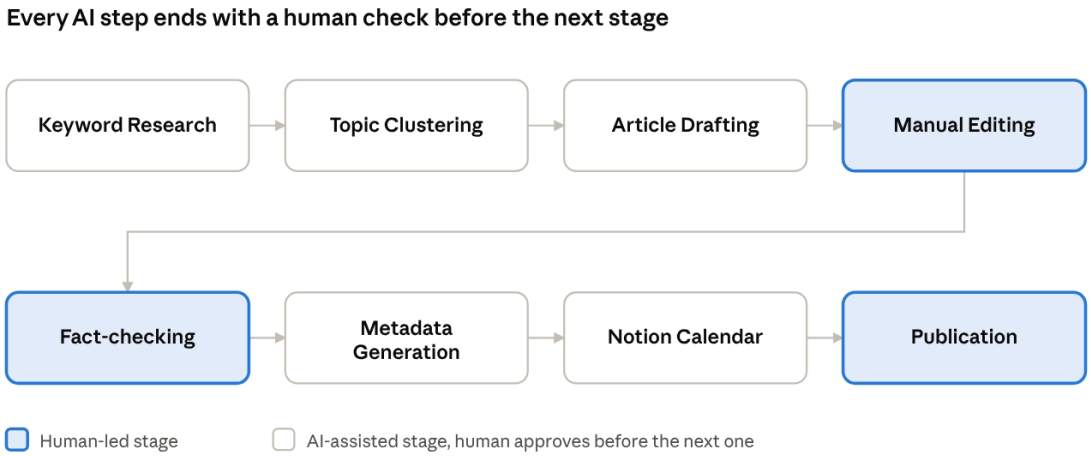

Appendix C – CSV file: see Part 6.

Part 14 – Final Presentation and Demo

A. Ten-slide presentation outline

Slide	Title	Content	Evidence to show
1	Title and question	Project name, your name, the project question	None
2	Problem and objectives	Why beginners need a checked AI process; the 7 objectives in short	None
3	Niche, audience and method	AI Tools and Digital Marketing for Students and Beginners; the 9-step method	Method list
4	Keyword research	The 20-keyword table (sample 5 rows), verification statuses, tools used	Your dated screenshots
5	Topic cluster map	Four pillars, pillar pages and supporting articles, internal links	Cluster table or diagram
6	AI workflow	Eight stages, human approval points, proposed versus implemented automation	Workflow diagram below
7	Prompt library	11 prompts; one prompt compared in versions A and B	Your real test table
8	Verification and hallucinations	Two or three real errors you found and corrected	Your verification log
9	Results, limitations, ethics	Real numbers, what was not tested, disclosure statement	Results table
10	Conclusion and questions	Main lesson, future work, thank you	None

B. Project workflow diagram (for slide 6)

project workflow for slide 6 · 8 stages

C. Five-minute live demonstration script

Practise with a timer. Keep screenshots ready as a backup if the internet or a free tool fails.

Time	What you do	What you say
0:00–0:30	Show the title slide	"My project asks how AI can help with keyword research and content planning for a blog. My rule is that AI drafts and I verify."
0:30–1:30	Open Google, type a seed keyword, show autocomplete and People Also Ask. Then show one Google Trends comparison	"These are real suggestions. Trends shows relative interest, not search volume, so I do not claim any numbers."
1:30–2:30	Run prompt P01 in an AI tool, then show the basic version beside it	"The improved prompt asks for intent and forbids invented numbers. Here is what changed in my test." (Use only your real result.)
2:30–3:30	Open one article draft and your verification log. Point to one real error you corrected	"AI can sound sure and still be wrong. This is the claim, the source I opened, and my correction."
3:30–4:15	Show the Notion database and calendar view built from the CSV	"Twenty articles, five per week, each with status and verification status."
4:15–5:00	Return to the slides: limitations and ethics	"I did not test rankings. Automation beyond CSV import is only proposed. AI use is disclosed."

D. Five viva questions with answers

1. How can AI help with keyword research, and what are its limits? AI can suggest keyword ideas, group them by intent and build topic clusters quickly. It cannot give reliable search volume or difficulty, and it may invent numbers. So I used it for ideas and checked them in Google suggestions, Google Trends and other tools.

2. What is search intent and how did you use it? Search intent is the reason behind a search: to learn, compare, find a site or buy. I labelled each keyword and article with an intent and checked the top results to confirm the page type, so each article matches what searchers want.

3. How did you deal with AI hallucinations? I asked AI to list claims that need checking, opened original sources, logged each claim with its source and correction, and removed anything I could not confirm. The log shows real counts, including claims that were correct.

4. What did you automate and what did you only propose? I only claim what I ran and saved proof for. CSV import into Notion is [implemented and tested / not tested – state the truth]. Tools such as Zapier or scheduled posting are proposed and not tested.

5. How did you keep the work original and ethical? I edited the AI drafts, added my own examples, checked for plagiarism, cited only sources I opened, avoided private data in prompts, and included a disclosure statement. I am responsible for the final content.

E. Final submission checklist

- ☐ All 14 parts are included in the report in the chapter order from Part 13.
- ☐ At least four tools are actually used, and the Tool Use Log has dates and evidence.
- ☐ Keyword statuses are updated after real checks.
- ☐ Both articles are edited, fact-checked and marked Reviewed (or clearly labelled as AI-assisted drafts).
- ☐ Verification log contains real entries; illustrative examples are labelled.
- ☐ Before-and-after table has real scores or is clearly labelled illustrative.
- ☐ Notion database is built manually and screenshotted.
- ☐ References contain only sources you opened, with access dates.
- ☐ Every [YOUR RESULT] placeholder is filled or removed.
- ☐ Plagiarism reports are saved.
- ☐ AI-use disclosure statement is included and edited to match what you used.
- ☐ The syllabus-based skills mapping is updated, or still marked provisional.
- ☐ Slides, demo backup screenshots and a printed or PDF report are ready.
- ☐ You can explain every part of the project in your own words.
